

Explicit Asian-American Bias

We are interested in predicting Explicit Asian-American Bias scores in US citizens. We are predicting **differences scores of feeling thermometers** (0-extremely cold to 10-extremely warm) for White Americans and Asian Americans, **where higher numbers indicate a preference for White Americans over Asian Americans**. Scores can range from -10 to 10.

We obtained explicit stereotypes data from [Project Implicit](https://projectimplicit.org/). To assess Asian-American bias, participants provided ratings on feeling thermometers (0 – extremely cold to 10 – extremely warm) towards Asian-Americans and White Americans. Bias score was calculated as the difference in responses to White-American vs. Asian-American groups on feeling thermometers, with higher score reflecting less positive attitude towards Asian-Americans compared to White-Americans. To correct sample non-representativeness, we weighted the estimates based on race, age, and political orientation (1).
